

SAKIKO acts on this decision — before any tool executes

MODEL

**CORRECTION** · can we intervene?

**ADJUDICATION** · what did it accomplish?

SAKIKO

*behaviour changed — but was it repaired?*

$$c = (y^* \rightarrow \hat{y}_0)$$

$$r(h_{obs}) \rightarrow (\hat{c}, p_c, \text{fire?})$$

$$\theta_c = \{d_c, \ell_{obs}, \ell_{inj}, q_c, \text{gate}\}$$

no channel fires → unchanged    matched-control specificity

EVIDENCE

*Verify — every outcome resolved, not merely counted*

was a baseline ERROR  $\hat{y}_0 \neq y^*$

**SOURCE  
RETAINED**

$$\hat{y}_1 = \hat{y}_0$$

**GOLD  
ARRIVAL**

$$\hat{y}_1 = y^*$$

**OTHER  
WRONG**

left source,  
still wrong

was already CORRECT  $\hat{y}_0 = y^*$

**CORRECT  
RETAINED**

preserved

**BROKEN**

damaged

$$\text{target hit} = \text{GOLD\_ARRIVAL} / (\text{GOLD\_ARRIVAL} + \text{OTHER\_WRONG})$$

collateral is reported on a named denominator; zero exposure is vacuous

*License — a property of the evidence*

**Adjudicable**

measurable at all

→ Readable

the state is decodable

→ Steerable

specific beyond controls

→ Correctable

arrivals concentrate on gold

→ Preserving

correct behaviour survives

→ **Licensable**

evidence supports the claim

**Correctable ≠ Preserving ≠ Licensable**

*a favourable estimate can still be declined*

DECLINE = insufficient evidence,  
not intrinsic uncorrectability
