

OFFLINE · channel discovery and candidate construction

1 DIAGNOSTIC PASS · read

2 INTERVENTION PASS · gated write

otherwise the forward pass is left untouched — no prompt edit, no weight update, no rewriting of the emitted answer

one block, expanded

DESTINATION-RESOLVED OUTCOME

for a baseline error on channel $c = (g \rightarrow s)$, exactly three mutually exclusive post-intervention outcomes:

SOURCE_RETAINED

$\hat{a}' = s$ error persists

under conventional accuracy

still wrong

GOLD_ARRIVAL

$\hat{a}' = g$ genuine repair

correct

OTHER_WRONG

$\hat{a}' = w \in A_D \setminus \{g, s\}$ error redistributed

still wrong

conventional accuracy collapses $\{\text{SOURCE_RETAINED}, \text{OTHER_WRONG}\}$; destination resolution separates all three: source exit = gold arrival + other-wrong

SECOND POPULATION · preservation

collateral damage is a distinct estimand, measured on a disjoint population — it is never netted against repairs

SAKIKO CLAIM STRUCTURE
