

(a) conditional intervention in a frozen model

$L_{inj} < L_{obs}$ — diagnosis and intervention are separate passes

DESTINATION-RESOLVED OUTCOME

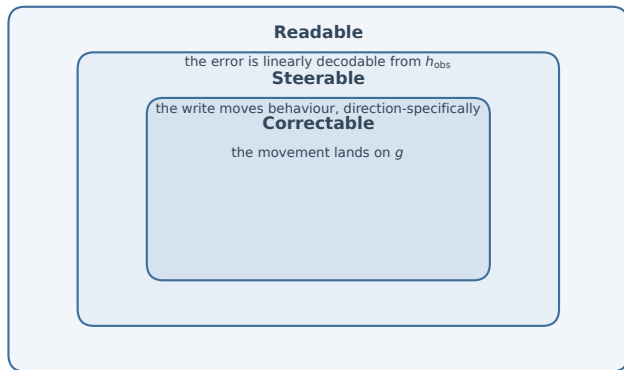

one directed error $c = (g \rightarrow s)$, three outcomes

conventional accuracy collapses the two wrong outcomes

(b) what was shown, and what may be asserted

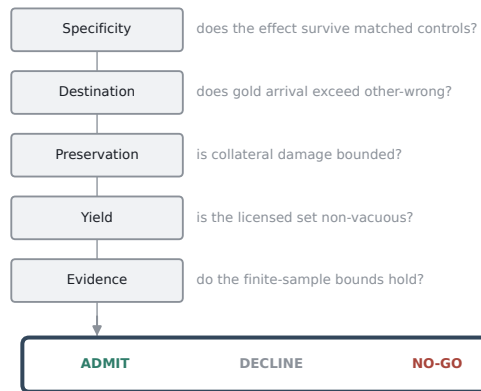

ADJUDICABLE

Correctable $\subset$ *Steerable* $\subset$ *Readable* — each stronger claim is a strict subset of the weaker one it presupposes

entry condition — the study can answer the question at all:
 $|A_D| \geq 3$, a supported channel, sufficient rows in every split

- **LICENSABLE** — an evidential decision, not a property

DECLINE reports the state of the evidence — not that the setting is uncorrectable
